**Procurement Objective:** Make an impression for fabrication of a working cast utilizing a closed-tray, indirect transfer method when a flared emergence Healing Abutment was used. The procedure creates a cast that represents the exact position of the implant as well as the orientation of the external hex.

### Lab Steps

#### 1. Remove Healing Abutment

Remove the flared emergence Healing Abutment with the 0.050” (1.25mm) Hex Driver. Confirm that the implant’s prosthetic platform is free of bone debris or soft tissue.

#### 2. Place Transfer Coping

Seat the 3inOne Abutment and secure it with a Ball-top Screw (hand-tighten).

If practical, orient the long flat side of the abutment to the facial for easier indexing.

Radiographically verify correct seating of the abutment.

#### 3. Block out hex hole

Block out the hex-hole on top of the Ball-top Screw with a material of choice.

#### 4. Make full-arch impression

Syringe a light-body elastomeric impression material around the coping assembly. Record the full arch impression using the closed tray loaded with heavier body impression material.

Remove the coping assembly after the tray has been removed. Replace the Healing Abutment immediately to prevent soft tissue collapse.

#### 5. Assemble coping and analog

Use the Ball-top Screw to assemble the 3inOne Abutment with the corresponding Implant Analog.

#### 6. Index coping into impression

Insert the coping assembly into the corresponding location in the impression, ensuring that the long flat of the abutment aligns with the corresponding indice within the impression.

Send the impression, coping/analog assembly, abutment screw, bite registration and opposing model to the lab.

#### 7. Create soft tissue model

A soft tissue replica material is recommended around the analog. Verify analog seating and apply lubricant where soft tissue replica material is to be applied.

#### 8. Fabricate working cast

Fabricate a working cast. Articulate according to standard laboratory procedures.

**Send to Lab**

- Impression
- 3inOne/Ball-top Screw combo
- Abutment Screw (comes with 3inOne)
- Implant Analog
- Bite Registration
- Opposing model or impression
- Shade selection
**DIRECT PICK-UP**

**Procedure Objective:** Make an impression for fabrication of a working cast utilizing an open-tray, direct pick-up method. The procedure creates a cast that represents the exact position of the implant. Hex orientation may be registered (single-unit) or bypassed (multiple-units) depending on the coping selected.
