Laser-Lok Technology

Laser-Lok overview
Laser-Lok microchannels is a proprietary dental implant surface treatment developed from over 20 years of research initiated to create the optimal implant surface. Through this research, the unique Laser-Lok surface has been shown to elicit a biologic response that includes the inhibition of epithelial downgrowth and the attachment of connective tissue (unlike Sharpey fibers). This physical attachment produces a biologic seal around the implant that protects and maintains crestal bone health. The Laser-Lok phenomenon has been shown in post-market studies to be more effective than other implant designs in reducing bone loss.

Unique surface characteristics
Laser-Lok microchannels is a series of cell-sized circumferential channels that are precisely created using laser ablation technology. This technology produces extremely consistent microchannels that are optimally sized to attach and organize both osteoblasts and fibroblasts. The Laser-Lok microstructure also includes a repeating nanostructure that maximizes surface area and enables cell pseudopodia and collagen microfibrils to interdigitate with the Laser-Lok surface.

Different than other surface treatments
Virtually all dental implant surfaces on the market are grit-blasted and/or acid-etched. These manufacturing methods create random surfaces that vary from point to point on the implant and alter cell reaction depending on where each cell comes in contact with the surface. While random surfaces have shown higher osseointegration than machined surfaces, only the Laser-Lok surface has been shown using light microscopy, polarized light microscopy and scanning electron microscopy to also be effective for soft tissue attachment.
The clinical advantage

The Laser-Lok surface has been shown in several studies to offer a clinical advantage over other implant designs. In a prospective, controlled multi-center study, Laser-Lok implants, when placed alongside identical implants with a traditional surface, were shown at 37 months post-op to reduce bone loss by 70% (or 1.35mm). In a retrospective, private practice study, Laser-Lok implants placed in a variety of site conditions and followed up to 3 years minimized bone loss to 0.46mm. In a prospective, University-based overdenture study, Laser-Lok implants reduced bone loss by 63% versus NobelReplace Select.

Latest discoveries

The establishment of a physical, connective tissue attachment (unlike Sharpey fibers) to the Laser-Lok surface has generated an entirely new area of research and development: Laser-Lok applied to abutments. This could provide an opportunity to use Laser-Lok abutments to create a biologic seal and Laser-Lok implants to establish superior osseointegration—a solution that offers the best of both worlds. Alternatively, Laser-Lok abutments could support peri-implant health around implants without Laser-Lok. In a recent study, Laser-Lok abutments and standard abutments were randomly placed on implants with a grit-blasted surface to evaluate the differences. In this proof-of-principle study, a small band of Laser-Lok microchannels was shown to inhibit epithelial downgrowth and establish a connective tissue attachment (unlike Sharpey fibers) similar to Laser-Lok implants. This time, however, the attachment was established above the dental implant-abutment connection and even on implants with a machined collar. The resulting crestal bone levels were higher than what was seen with standard abutments and provides some insight into the role soft tissue stability may play in maintaining crestal bone health.

Laser-Lok Technology is available on Laser-Lok 3.0, Tapered Internal, Single-stage & Internal implants

* NobelReplace is a trademark of Nobel Biocare.
Tapered Internal dental implants provide excellent primary stability, maximum bone maintenance and soft tissue attachment for optimal esthetics. The Tapered Internal implant achieves these benefits from its anatomically tapered dental implant body, aggressive buttress threads and advanced Laser-Lok surface technology. The deep 1.5mm internal hex connection with a lead-in tapered bevel create a rigid connection and a stable biologic seal.

- Excellent primary stability from anatomically tapered body
- Compressive bone loading from proprietary buttress threads
- Stable soft tissue seal and flexible implant placement from Laser-Lok microchannels

Laser-Lok shown to have functionally-oriented connective tissue attachment.1

Buttress threads have a wide, flat leading edge for increased functional surface area, improved axial load distribution and primary stability.
TAPERED INTERNAL IMPLANTS

Tapered Internal Implants with Laser-Lok
Laser-Lok collar with Resorbable Blast Texturing (RBT) on implant body. Comes packaged with Cover Cap, Abutment Screw and pre-mounted 3inOne esthetic abutment that serves as a fixture mount, closed-tray transfer and final abutment. Titanium Alloy.

**ANCILLARY INSTRUMENTS**

**Drivers**

**PADHH**
Abutment-level Driver, Hex-chuck Handpiece*

Use with compatible W&H Hexagon Chucking System Handpieces to prevent deformation of the ISO shank latch connection in high-torque applications.

**Adjustable Torque Wrenches**

**EL-C12374**
Elos Adjustable Torque Wrench

Lightweight titanium design is easy to use as an adjustable torque wrench or a ratchet. Quickly disassembles for cleaning. No calibration required.

**ATW**
ITL Precise Adjustable Torque Wrench

Place both implants and abutments with 9 distinct torque settings (15, 20, 25, 30, 35, 40, 45, 50 and 60 Ncm). A simple twist of the handle locks in precision-engineered torque values and guarantees accuracy and repeatability.

**Tissue Punches**

**PYTP**
3.5mm Tissue Punch

Use in a latch-type handpiece to remove the soft tissue from the crest of the ridge prior to osteotomy preparation in a flapless surgical procedure. Available in three platform diameters.

**PGTP**
4.5mm Tissue Punch

**PBTP**
5.7mm Tissue Punch

**Bone Profiling Burs**

**PYBP**
3.5mm Bone Profiling Bur & Guide

Use at implant uncovery to contour crestal bone for abutments when the implant is subcrestal. The Profiling bur’s internal geometry matches the geometry of the included Profiler Guide. The Guide is screwed into the implant and then aligns the Profiling bur’s for precise removal of tissue surrounding the platform. Available in three sizes.

**PGBP**
4.5mm Bone Profiling Bur & Guide

**PBBP**
5.7mm Bone Profiling Bur & Guide

SIMPLE SOLUTIONS ABUTMENTS WITH LASER-LOK TECHNOLOGY

With the success of BioHorizons Laser-Lok technology on implants, BioHorizons breaks new ground by applying this innovative technology to abutments. Simple Solutions abutments with Laser-Lok are designed to be seated at the time of implant placement or uncovering and remain in place through final restoration\(^1,3\). This establishes and maintains the connective tissue attachment.

**Laser-Lok has been shown to:**
- Inhibit epithelial downgrowth\(^1,3\)
- Attract a physical connective tissue attachment\(^1,3\)
  (unlike Sharpey fiber attachment)
- Preserve the coronal level of bone\(^1,3\)

Simple Solutions crowns finish on the restorative shoulder of the abutment. There are three options for transmucosal collar height: 0.8mm / 1.8mm / 2.8mm. Select the collar height that positions the restorative shoulder as close as possible to the desired position of the crown margin while allowing for the Laser-Lok zone to be 1-2mm subgingival. Packaged with Abutment Screw (PXAS) and Healing Cap. Titanium Alloy. Final torque: 30Ncm.

### Restorative Packs

- **SYRP40**: 3.5mm Restorative Pack, 4.0mm Height
- **SYRP55**: 3.5mm Restorative Pack, 5.5mm Height
- **SGRP40**: 4.5mm Restorative Pack, 4.0mm Height
- **SGRP55**: 4.5mm Restorative Pack, 5.5mm Height
- **SBRP40**: 5.7mm Restorative Pack, 4.0mm Height
- **SBRP55**: 5.7mm Restorative Pack, 5.5mm Height

Each restorative pack contains impression cap, replica and two waxing sleeves.

INSTRUCTIONS FOR USE

This Surgical Manual serves as a reference for using the Tapered Internal implants and surgical instruments. It is intended solely to provide instructions on the use of BioHorizons products. It is not intended to describe the methods or procedures for diagnosis, treatment planning, or placement of implants, nor does it replace clinical training or a clinician’s best judgment regarding the needs of each patient. BioHorizons strongly recommends appropriate training as a prerequisite for the placement of implants and associated treatment.

The procedures illustrated and described within this manual reflect idealized patient presentations with adequate bone and soft tissue to accommodate implant placement. No attempt has been made to cover the wide range of actual patient conditions that may adversely affect surgical and prosthetic outcomes. Clinician judgment as related to any specific case must always supersede any recommendations made in this or any BioHorizons literature.

Before beginning any implant surgical procedure with BioHorizons implants:

- Read and understand the Instructions for Use that accompany the products.
- Clean and sterilize the surgical tray and instruments per Instructions for Use.
- Become thoroughly familiar with all instruments and their uses.
- Study Surgical Kit layout and iconography.
- Design a surgical treatment plan to satisfy the prosthetic requirements of the case.

Small diameter implants with angled abutments are intended for the anterior region of the mouth and are not intended for the posterior region of the mouth due to possible failure of the implant.

Indications

Tapered Internal Implants are intended for use in the mandible or maxilla for use as an artificial root structure for single tooth replacement or for fixed bridgework and dental retention. The implants may be restored immediately:

1) with a temporary prosthesis that is not in functional occlusion or
2) when splinted together for multiple tooth replacement or when stabilized with an overdenture supported by multiple implants.

VIP Treatment Planning

Virtual Implant Placement (VIP) treatment planning software is a user-friendly solution that reduces clinical challenges and enhances post-operative outcomes.

- Interactive 2D and 3D treatment planning
- Self processing DICOM converter
- Case viewer available for download from BioHorizons website
**Two-stage Protocol**

In a two-stage surgery, the implant is placed below the soft tissue and protected from occlusal function and other forces during osseointegration. A low-profile Cover Cap is placed on the implant to protect it from the ingress of soft tissue.

Following osseointegration, a second procedure exposes the implant and a transmucosal Healing Abutment is placed to allow for soft tissue healing and development of a sulcus. Prosthetic restoration begins after soft tissue healing.

**Single-stage Protocol**

Single-stage surgery may be accomplished by placing a healing abutment at the time of implant surgery. This eliminates the need for a second procedure. Although the implant is not in occlusal function, some forces can be transmitted to it through the exposed transmucosal element.

Prosthetic restoration begins following osseointegration of the implant and soft tissue healing.

**Non-functional Immediate Restoration**

Single-stage surgery with non-functional immediate provisionalization provides the patient a non-functioning provisional prosthesis early in the treatment plan. An abutment is placed on the implant at or shortly after surgery, and a provisional restoration is secured using temporary cement. The provisional can help shape the soft tissue profile during healing.

**Immediate Function Restoration**

Single-stage surgery with immediate function is possible in good quality bone where multiple implants exhibiting excellent initial stability can be splinted together. Splinting implants together can offer a significant biomechanical advantage over individual, unsplinted prostheses.
During implant placement, clinicians must apply their best judgment as to the appropriate spacing for individual patient conditions.

The osteotomy centerpoint required to maintain a 1.5mm implant-to-tooth spacing (generally accepted) is 
\[ \frac{1}{2} \text{[implant body diameter]} + 1.5 \text{mm}. \]

The osteotomy center-to-center measurement required to maintain a 3.0mm edge-to-edge spacing (generally accepted) between Tapered Internal implants is 
\[ \frac{1}{2} \text{[sum of 2 implant body diameters]} + 3.0 \text{mm}. \]

**Implant Spacing**

**Implant Spacer / Depth Probe**

**Purpose:** Multi-function instrument for intraoral measurements.
- Five centimeter graduated ruler on shaft

The rectangular end of the tool provides intraoral measurements.

Useful for marking center-to-center implant spacing on the ridge.

The rectangular end against an existing crown places the osteotomy ∼4.25mm from the contact.

Probe tip measures osteotomy depth. **Note:** these markings are different than the tapered drill markings.

---

**Table: Osteotomy Centerpoint and Center-to-Center Spacing**

Measurement is dependent on the two implant body diameters. (4.6 & 5.8mm implants pictured)
**IMPLANT PLACEMENT LEVEL & SURGICAL KIT LAYOUT**

### Placement in Uneven Ridges

When placing the Tapered Internal implant in an uneven ridge, prepare the osteotomy and place the implant so that the bone/soft-tissue junction is within the Laser-Lok transition zone. If the discrepancy is more than the Laser-Lok transition zone, leveling the ridge can be considered.

### Surgical Kit Layout

The Tapered Internal Surgical Kit uses an intuitive layout to guide the surgeon through the instrument sequence. The sequence begins in the upper left hand corner and works left-to-right and then down. Color-coded lines, instruments and grommets are matched with each implant and further aid in instrument selection and identification.

Prior to use, clean and sterilize the surgical tray and instruments per appropriate Instructions for Use and study the Surgical Kit layout, color-coding and iconography. Surgical assistants should also be thoroughly familiar with all instruments and their uses.
All surgical drills included with this system are externally irrigated and designed to be used at drill speeds of 850-2500 rpm with steady sterile irrigation. Reduced drill speed may be indicated in softer bone or as drill diameter increases.

**Important Considerations**

- Peri-operative oral rinses with a 0.12% Chlorhexidine Digluconate solution have been shown to significantly lower the incidence of post-implantation infectious complications. A pre-operative 30-second rinse is recommended, followed by twice daily rinses for two weeks following surgery.

- Drilling must be done under a constant stream of sterile irrigation. A pumping motion should be employed to prevent over-heating the bone. Surgical drills and taps should be replaced when they are worn, dull, corroded or in any way compromised. BioHorizons recommends replacing drills after 12 to 20 osteotomies. A Drill-usage Tracking Chart is available at biohorizons.com to record this important information.

- There is a risk of injury to the mandibular nerve associated with surgical drilling in posterior mandibular regions. To minimize the risk of nerve injury, it is imperative that the clinician understands the drill depth markings as they relate to the implant length to produce the desired vertical placement of the implant.

### Note: The depth marks are consistent throughout the Starter Drills, Depth Drills and Width Increasing Drills
**OSTEOTOMY INITIALIZATION**

**2.0mm Starter Drill**

*Purpose:* Initiate osteotomy.

- Chisel-tip design eliminates “skating” on osseous crest
- Prepares site for Paralleling Pins
- Matte finish for increased visibility under operatory lights

**2.5mm Depth Drill**

*Purpose:* Set osteotomy depth.

- Efficient cutting drill design collects bone for autografting
- Matte finish for increased visibility under operatory lights

The 2.0mm and 2.5mm depth drills are designed to increase and/or set the depth of the osteotomy.

**2.5mm Depth Drills with Stops**

*Purpose:* Set osteotomy depth when access or visibility is poor.

- Fixed circular ring acts as a definitive drill stop
- One drill length for each implant length
- 1 mm laser-etched line guides supracrestal implant placement
- BioHorizons Surgical Kit includes spare slots for Depth Drills with Stops or Extended Shank Drills

**shop online at www.biohorizons.com**
Paralleling Pins

Purpose: Evaluate osteotomy position and angle.
- Provided straight or with a 20° angle
- Use after 2.0mm Starter Drill and 2.5mm Depth Drill
- 9mm shank for radiographic evaluation of proximity to adjacent anatomy
- Hub diameter is 4.0mm

3.2 - 5.4mm Width Increasing Drills

Purpose: Incrementally widen the osteotomy to reduce heat generation.
- Depth-marked for reference
- Efficient cutting drill design collects bone for autografting
- The drill tip has limited end cutting. However, the osteotomy depth can be increased with these drills as needed
- Matte finish for increased visibility under operatory lights

Depth Gauges

Purpose: Verify osteotomy depth.
- Depth marks for reference
- Use following the final Width Increasing Drill for each implant
- Place the depth gauge into the osteotomy site, adjust osteotomy depth as necessary
- Can also be used after 2mm drill by inverting
**Purpose:** Remove cortical bone at ridge crest for pressure-free seating of the implant collar.

- Use when dense cortical bone is present at crest
- Rounded non-end cutting hub centers drill in osteotomy
- Use following the final Width Increasing Drill for each implant

**Crestal Bone Drills**

**Purpose:** Prepare dense cortical bone for implant threads.

- Site specific
- 30 rpm or less
- Final instrument prior to implant placement
- Can be driven with a handpiece, Ratchet or Hand Wrench

Place into the osteotomy, apply firm apical pressure and rotate slowly in a clockwise direction. When the threads engage, allow the tap to feed without excessive pressure. To remove, rotate the Bone Tap in a counterclockwise direction, allowing it to back out of the osteotomy. **Do not pull on the Bone Tap to remove it from the site.**

**Bone Taps**

**Purpose:** Engage the pre-mounted 3inOne Abutment to drive into the osteotomy.

- Drivers interface with the internal square of the 3inOne Abutment
- PEEK plastic snap ring secures 3inOne Abutment
- 30 rpm or less

**Abutment-Level Drivers**

**Purpose:** Engage the implant’s internal hex to drive mount-free implants into the osteotomy.

- May also be used following removal of the 3inOne Abutment
- Offers a narrower path of insertion than placing with a mount
- 30 rpm or less

**Implant-level Drivers**
**3inOne Mount Transfer**

The Cover Cap for a two-stage surgical protocol is mounted on a plastic base and packaged in the vial underneath the implant.

Engage the 3inOne Abutment with the PEEK snap ring of the Abutment-level driver. The driver square has no retentive feature and does not need to be engaged. The driver square will automatically engage in the osteotomy when the driver is slowly rotated under apical pressure.

**Mount-free Transfer**

The Cover Cap for a two-stage surgical protocol is mounted in the vial cap.

Engage the implant with the PEEK snap ring of the Implant-level Driver. The hex of the driver has no retentive feature and does not need to be engaged. The driver hex will automatically engage in the osteotomy when the driver is slowly rotated under apical pressure.

Excess pressure can deform the implant basket and should be avoided.
PLACEMENT & ORIENTATION

Implant Placement

Place the apex of the implant into the osteotomy, apply firm apical pressure and begin rotating slowly (30 rpm or less is recommended).[1] When the threads engage, allow the implant to feed without excessive pressure. If the handpiece is unable to fully seat the implant, remove the 3inOne and complete placement using the implant-level driver, ratchet.

To avoid bone damage, the 3inOne abutment is designed to yield prior to the implant. This yield can occur at insertion torque levels above 120 Ncm. If an abutment yield occurs, placement can be completed at the implant level and a new 3inOne Abutment can be used for impression making.

Abutment Removal

To remove the 3inOne Abutment, engage the Abutment Screw with the .050" (1.25mm) Hex Driver. Apply firm apical pressure to the Hex Driver and rotate counter-clockwise until the screw is completely disengaged from the implant body.

In soft bone, or when the implant lacks initial stability, an Abutment Clamp (ref. IMPAH, sold separately) should be used to grasp the outside of the abutment to provide counter-torque during the loosening of the Abutment Screw.

The 3inOne Abutment and the Abutment Screw should be retained with the patient’s chart. They can later be used in the impression making procedure and as a temporary or final abutment for cement retention.

Difficulty removing the 3inOne Abutment may indicate that the yield point of the abutment has been exceeded. It is possible that this can create up to a 10º rotational impression error if the lab uses a substitute 3inOne Abutment when creating the stone model. If this occurs, a new impression with a new 3inOne Abutment must be made.

Internal Hex Orientation

When seating the implant, use the corresponding dimples on the driver to orient one internal hex flat perpendicular to the implant angulation plane. Doing so verifies that an angled abutment will correct the angulation.
**Post-Operative Instructions**

A period of unloaded healing time is often recommended to allow for integration between the bone and implant surface. This is dependent on individual patient healing rates and bone quality of the implant site. Each case must be independently evaluated.

The patient should be instructed to follow a post-surgical regimen including cold packs for 24 hours post-implantation. The patient’s diet should consist of soft foods and possibly dietary supplements. Pharmacological therapy should be considered as the patient’s condition dictates.

If a removable prosthesis is used during the initial healing phase, a soft liner material should be used to prevent pressure on the surgical site. Relieve the prosthesis over the implant site prior to the soft liner application. Periodically check the patient’s soft tissue and bone healing using clinical and radiographic evaluations.

Ongoing hygiene for the implant patient is vital. Hygiene recall appointments at three month intervals are suggested. Instruments designed for implant abutment scaling, such as Implacare® instruments from Hu-Friedy® should be utilized. The stainless steel handles may be fitted with assorted tip designs for hygiene on natural teeth. The Implacare® scalers contain no glass or graphite fillers that can scratch titanium implant abutments.

**Surgical Kit Cleaning**

All BioHorizons Surgical Kits are provided non-sterile and must be cleaned and sterilized prior to use. Always remove instruments from packaging prior to sterilization, and remove and discard packaging materials used to stabilize and secure kits during shipment. Double-check all surgical instruments to ensure their functionality prior to surgery. Backup sterile drills are also recommended.

*Caution:* The use of hydrogen peroxide or other oxidizing agents will cause damage to the surface of the instruments. Towel- or air-dry all instrumentation before sterilizing. After sterilization, use an adequate drying cycle to evaporate any moisture that can stain the instruments. Drills and taps should be replaced when wear is noticed, such as a decrease in cutting efficiency or when signs of discoloration appear. Drills should be replaced after approximately 12 to 20 osteotomy cycles, depending on the bone density. Drill usage charts can be downloaded from www.biohorizons.com.

Proper testing, cleaning and calibration of sterilization equipment should occur frequently to assure that the units are in proper working order. Equipment operating conditions vary and it is the responsibility of each dental office to ensure that the proper sterilization technique for instrumentation is followed.

**Bone Profilers**

*Purpose:* Remove and contour excess bone and soft tissue from the area of the prosthetic platform.

- Compatible with latch-type, speed-reducing handpieces
- 850-2,500 rpm drill speed with steady sterile irrigation
- Profiler Guide protects implant platform
- Bone Profiler cuts away excess bone and soft tissue
- Color-coded by specific prosthetic platform

*Do not use the Profiler without the Guide in place.*

To use, remove the surgical Cover Cap from the implant and place the Profiler Guide [both use the .050” (1.25mm) Hex Driver]. Use the Profiler with copious amounts of sterile irrigation. Once the excess bone and soft tissue are removed, unscrew the Guide and seat the appropriate prosthetic component.
HEALING PROTOCOLS

Cover Caps for two-stage protocol

**Purpose:** Protects prosthetic platform in two-stage (submerged) surgical protocols.

- Irrigate implant to remove blood and other debris
- Use an antibacterial paste to decrease the risk of bacterial growth
- Hand-tighten (10-15 Ncm) utilizing .050” (1.25mm) Hex Driver
- Color-coded by prosthetic platform

Healing Abutments for single-stage protocol

**Purpose:** Transmucosal element for developing soft tissue emergence with Narrow, Regular, Wide Emergence or Simple Solutions Internal system prosthetic components.

- Irrigate implant to remove blood and other debris
- Use an antibacterial paste to decrease the risk of bacterial growth
- Hand-tighten (10-15 Ncm) utilizing .050” (1.25mm) Hex Driver
- Color-coded by prosthetic platform
- Laser marked for easy intraoral identification, for example: GR3 = Green (4.5mm) platform / Reg. Emerg. / 3mm High

Immediate Provisional Restorative Options

**Temporary Abutments**

**Purpose:** Easily modified for fabrication of cement or screw-retained provisional restorations. A Direct Coping Screw (purchased separately) may be used to maintain a screw access hole during the fabrication of a screw-retained provisional prosthesis.

**Simple Solutions**

**Purpose:** When a Simple Solutions restoration is planned, the tooth-colored Healing Cap that comes packaged with the abutment may be used as a coping for an immediate provisional restoration.
Symbol Descriptions for Product Labeling

- **REF**: Reference/article number
- **LOT**: Lot/batch number
- **Use before expiration date (YYYY-MM)**
- **Manufacture date (YYYY-MM)**
- **STERILE**: Sterile by gamma irradiation
- **NON-STERILE**: Non-sterile
- **Rx Only**: Caution: Federal (USA) law restricts these devices to the sale, distribution and use by, or on the order of, a dentist or physician.
- **Artwork label number**

**References**

12. Adequate primary stability required.
13. Removing the abutment after initial placement may disrupt the connective tissue attachment.
**ORDERING & WARRANTY INFORMATION**

**Product Support Specialist:**

**Cell phone:**

**Fax:**

**BioHorizons Lifetime Warranty on Implants and Prosthetics:** All BioHorizons implants and prosthetic components include a Lifetime Warranty. BioHorizons implant or prosthetic components will be replaced if removal of that product is due to failure (excluding normal wear to overdenture attachments).

**Additional Warranties:** BioHorizons warranties instruments, surgical drills, taps, torque wrenches and Virtual Implant Placement (VIP) treatment planning software.

1. **Surgical Drills and Taps:** Surgical drills and taps include a warranty period of ninety (90) days from the date of initial invoice. Surgical instruments should be replaced when they become worn, dull, corroded or in any way compromised. Surgical drills should be replaced after 12 to 20 osteotomies.

2. **Instruments:** The BioHorizons manufactured instrument warranty extends for a period of one (1) year from the date of initial invoice. Instruments include drivers, sinus lift components, implant site dilators and BioHorizons tools used in the placement or restoration of BioHorizons implants.

3. **VIP treatment planning software:** VIP treatment planning software warranty extends for a period of ninety (90) days from the date of initial invoice. The warranty requires that VIP be used according to the minimum system requirements.

4. **Compu-Guide surgical templates:** Compu-Guide surgical templates are distributed without making any modifications to the submitted Compu-Guide Prescription Form and VIP treatment plan ("as is"). BioHorizons does not make any warranties expressed or implied as it relates to surgical templates.

**Return Policy:** Product returns require a Return Authorization Form, which can be acquired by contacting Customer Care. The completed Return Authorization Form should be included with the returned product. For more information, please see the reverse side of the invoice that was shipped with the product.

**Disclaimer of Liability:** BioHorizons products may only be used in conjunction with the associated original components and instruments according to the Instructions for Use (IFU). Use of any non-BioHorizons products in conjunction with BioHorizons products will void any warranty or any other obligation, expressed or implied.

Treatment planning and clinical application of BioHorizons products are the responsibility of each individual clinician. BioHorizons strongly recommends completion of postgraduate dental implant education and adherence to the IFU that accompany each product. BioHorizons is not responsible for incidental or consequential damages or liability relating to use of our products alone or in combination with other products other than replacement or repair under our warranties.

Compu-Guide surgical templates are ordered under the control of a Clinician. The Clinician recognizes responsibility for use. Therefore, regardless of the real or proven damages, the liability to BioHorizons is limited to the price of the product directly related to the reason for the claim.

**Distributed Products:** For information on the manufacturer’s warranty of distributed products, please refer to their product packaging. Distributed products are subject to price change without notice.

**Validity:** Upon its release, this literature supersedes all previously published versions.

**Availability:** Not all products shown or described in this literature are available in all countries. BioHorizons continually strives to improve its products and therefore reserves the right to improve, modify, change specifications or discontinue products at any time.

Any images depicted in this literature are not to scale, nor are all products depicted.
Not all products shown or described in this literature are available in all countries. As applicable, BioHorizons products are cleared for sale in the European Union under the EU Medical Device Directive 93/42/EEC and the tissues and cells Directive 2004/23/EC. We are proud to be registered to ISO 13485:2003, the international quality management system standard for medical devices, which supports and maintains our product licences with Health Canada and in other markets around the globe.
