external implant system

uncompromised strength, proven success
BioHorizons uses science and innovation to create unique products with proven surgical and esthetic results.

Our advanced implant technologies, biologic products and computer guided surgery software have made BioHorizons a leading dental implant company.

BioHorizons is dedicated to developing evidence-based and scientifically proven products. From the launch of the External implant system (Maestro) in 1997, to the Laser-Lok 3.0 implant in 2010, dental professionals as well as patients have confidence in our comprehensive portfolio of dental implants and biologics products.

Our commitment to science, innovation and service has aided us in becoming one of the fastest growing companies in the dental industry. BioHorizons has helped restore smiles in 85 markets throughout Asia, North America, South America, Africa, Australia and Europe.

Gold-hued TiN coating for soft tissue esthetics

Patented Guide Pin saves time and eliminates cross threading

Low-profile Abutment Screw uses industry standard .050" (1.25mm) hex

Spiralock® technology virtually eliminates screw loosening

Prosthetic platform 0.2mm wider than implant body

Stable 1mm high external hex

0.5mm machined collar

Stated implant length

Implant body diameter

• Transmits 10 times less destructive shear than conventional v-threads
• Shown to achieve bone-to-implant contact levels of 80.6%
• Higher reverse torque values than conventional v-thread implants
• 4 platform/body diameters: 3.5mm, 4.0mm, 5.0mm, 6.0mm
• 5 lengths: 7mm, 9mm, 10.5mm, 12mm, 15mm

Originally known as the Maestro, the External implant has performed masterfully in every published study since its launch in 1997. With success rates from 98.5% to 100% in studies of up to 1,400 implants in a wide variety of placement and loading conditions, clinicians can confidently rely on the External to achieve consistent, reproducible results necessary to build a successful implantology practice.
**Crestal bone maintenance leads to success**

A prospective, multicenter trial showed a 5-year cumulative success rate of 99.5% for 495 External implants in 151 patients. There were no significant differences in the results by center, implant type, bone density, area of the mouth or prosthesis type. Crestal bone loss from prosthesis delivery to one-year follow-up was extremely low (0.06mm), and actually turned into bone gain at later follow-up intervals.\(^5\)

Radiographs of External implants in function for more than 6 years. Note that the crestal bone levels are maintained above the level of the first thread. Courtesy of Dr. Carl E. Misch.

**Increased surface area for immediate loading success**

Bone is strongest in compressive loading, weakest in shear. External’s square-thread design imparts 10 times less destructive stresses at the implant / bone interface than conventional v-thread designs, while maximizing compressive load transfer and providing excellent primary stability. These attributes have become increasingly important with the emergence of early and immediate load protocols.\(^6,7,8\)

The square-thread design provides up to 154% greater surface area than conventional v-thread designs. A comparative study of thread designs (square-thread, v-thread and buttress thread) concluded that the square-thread design exhibited significantly higher reverse torque values and bone-to-implant contact than the other thread designs.\(^3\)

**Biomechanical thread form | Backed by science**

External implants feature the time-proven, biomechanical square thread which has been demonstrated to provide increased bone-to-implant contact and yield higher reverse-torque values

<table>

</tbody>
</table>

Multiple studies have demonstrated the BioHorizons square thread to be extremely reliable in immediate loading protocols. One study, summarized below, followed 242 BioHorizons implants through immediate functional and non-functional loading.

*Each 7mm implant comes packaged with the 3inOne Abutment, a short cover screw and a short Abutment Screw.

Please refer to the External - 7mm Length Implants manual (ref. L0151) for detailed instructions for use of the prosthetic components for 7mm implants.
## Healing Abutments

Use for tissue healing at second-stage uncover or as a transmucosal element for single-stage procedures. Color-coded by implant diameter. Hand-tighten with the .050” (1.25mm) Hex Driver. Titanium Alloy.

- **.050" (1.25mm) Hex Driver**

- **Hand Wrench**

- **4mm Square Drive Extender***
  
  Replaced 300-205 starting in June 2010.
  Includes PEEK C-ring for durable retention in Ratchet. Cannot be used with bone taps.

- **Ratchet**

- **Implant Spacer / Depth Probe**

---

*Instrument o-rings & c-rings wear out over time. If an instrument is no longer held securely by its associated driver, order a replacement ring through Customer Care.*
**Extended Shank Drills (not included in Surgical Kit)**

Extended Shank Drills are 8mm longer than our standard drills. They provide an intermediary increase in length between the standard drills used alone, or with the Drill Extender (ref. 122-100), which adds 16mm of length. The depth marks and cutting geometry are identical to our standard drills.

**Ratchet & Hand Wrench Extender**

300-205  
Ratchet & Hand Wrench Extender

Can be used with Bone Taps (page 7).

**Surgical Driver**

150-000  
Surgical Driver

Use to drive implants into the osteotomy, particularly in the anterior region. The driver holds the Abutment-level Driver, Ratchet which interfaces with the 3inOne Abutment. Also interfaces with the .050” (1.25mm) Hex Drivers as well as Bone Taps and the Implant-level Drivers, Ratchet.
ANCILLARY SURGICAL INSTRUMENTS

Ancillary Instruments (not included in Surgical Kit)

122-110   2.0mm Lindemann Bone Cutter

Side-cutting drill used to correct eccentric osteotomy preparations.

PYTP     3.5mm Tissue Punch
122-201   4.0mm Tissue Punch
122-202   5.0mm Tissue Punch
122-203   6.0mm Tissue Punch

BioHorizons Tissue Punches are used in a latch-type handpiece to remove the soft tissue from the crest of the ridge prior to osteotomy preparation in a flapless surgical procedure.

122-113   External Bone Profiler, 3.5mm
122-114   External Bone Profiler, 4.0mm
122-115   External Bone Profiler, 5.0mm
122-116   External Bone Profiler, 6.0mm

Use at implant uncovery to contour crestal bone to accommodate abutments when the implant is subcrestal. For use in latch-type reduction handpieces. The Profiler’s internal geometry matches the geometry of the surgical Cover Screw which aligns the Profiler for precise removal of tissue surrounding the platform.

134-350   .050” (1.25mm) Handpiece Hex Driver
134-450   .050” (1.25mm) Handpiece Hex Driver, Long

For installation and removal of Cover Screws, Healing Abutments and Abutment Screws. Use with latch-type contra-angle handpieces. WS-75 E/KM or similar. 134-450 is 5mm longer than the 134-350.

Adjustable Torque Wrenches

ATW      ITL Precise Adjustable Torque Wrench

Ratchet design places both implants and abutments with 9 distinct torque settings (15, 20, 25, 30, 35, 40, 45, 50 and 60 Ncm). A simple twist of the handle locks in precision-engineered torque values and guarantees accuracy and repeatability. Use with 4mm square drivers.

EL-C12374 Elos Adjustable Torque Wrench

Lightweight titanium design is easy to use as an adjustable torque wrench or a ratchet. Quickly disassembles for cleaning. No calibration required. Use with 4mm square drivers.
**Marketing Collateral**

- **L0151** *External - 7mm Length Implants*
  - Guides the clinician and laboratory through the nuances of placing and restoring BioHorizons External 7mm length implants. Includes ordering information for implants, 2.0 x 7mm Depth Drills and Radiographic Templates with 7mm length implants.
  - *NOTE*: 7mm length implants are not available in all countries; please call for availability in your market.

- **ML0103** *Patient Education – Tooth replacement with dental implants*
- **ML0114** *Patient Education – Stabilizing dentures using dental implants*

(products shown not to scale)
Ceramic Abutments for Esthetic Zone Restorations

- 223-315 3.5mm Ceramic Abutment
- 224-315 4.0mm Ceramic Abutment
- 225-315 5.0mm Ceramic Abutment
- 226-315 6.0mm Ceramic Abutment

Use to fabricate cement-retained, single- or multiple-unit prostheses. Packaged with an abutment screw (130-300 or 140-400) used only with External Ceramic Abutments. Yttria-stabilized Zirconia. Final torque: 30Ncm.

3inOne Abutments for Cement-retained Restorations

- 203-311 3.5mm 3inOne Abutment
- 204-411 4.0mm 3inOne Abutment
- 205-511 5.0mm 3inOne Abutment
- 206-611 6.0mm 3inOne Abutment

Use to fabricate cement-retained, single- or multiple-unit prostheses. Also use with a Ball-top Screw as a closed-tray, hexed-timed impression coping. Packaged with an abutment screw (130-300 or 140-300). Titanium Alloy. TiN coated. Final torque: 30Ncm.

Angled Abutments for Cement-retained Restorations

- 213-400 3.5mm Angled Abutment (17°)
- 214-400 4.0mm Angled Abutment (20°)
- 215-400 5.0mm Angled Abutment (20°)

Use to fabricate cement-retained, single- or multiple-unit prostheses. Packaged with an abutment screw (130-300 or 140-300). Titanium Alloy. Final torque: 30Ncm.

Angled Esthetic Abutments for Cement-retained Restorations

- 223-313 3.5mm Angled Esthetic Abutment
- 224-313 4.0mm Angled Esthetic Abutment
- 225-313 5.0mm Angled Esthetic Abutment

Use to fabricate cement-retained, single- or multiple-unit prostheses. Packaged with an abutment screw (130-300 or 140-300). Titanium Alloy. TiN coated. Final torque: 30Ncm.

If a 6.0mm abutment is not available, the 5.0mm abutment may be used.
INDIVIDUAL ABUTMENTS

Straight Abutments for Cement-retained Restorations

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>223-208</td>
<td>3.5mm Abutment for Cement, Non-hexed</td>
</tr>
<tr>
<td>224-208</td>
<td>4.0mm Abutment for Cement, Non-hexed</td>
</tr>
<tr>
<td>225-208</td>
<td>5.0mm Abutment for Cement, Non-hexed</td>
</tr>
</tbody>
</table>

Use to fabricate cement-retained, multiple-unit prostheses. One-piece, non-hex engaging abutment. Titanium Alloy. Final torque: 30Ncm.

Note: Must be prepped chairside followed by a conventional crown and bridge impression.

If a 6.0mm abutment is not available, the 5.0mm abutment may be used.
## Custom Castable (UCLA) Abutments - Hexed

<table>
<thead>
<tr>

</tr>
<tr>
<td>235-227</td>
<td>5.0mm Gold/Plastic Custom Castable Abutment, Hexed</td>
</tr>
<tr>
<td>236-227</td>
<td>6.0mm Gold/Plastic Custom Castable Abutment, Hexed</td>
</tr>
</tbody>
</table>

Use for single-unit screw-retained or custom abutment cement-retained restorations. Packaged with an abutment screw (130-300 or 140-300). Gold Alloy base with natural acetyl (Delrin® or Pomalux®) sleeve. Final torque: 30Ncm.

## Custom Castable (UCLA) Abutments - Non-hexed

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>233-217</td>
<td>3.5mm Plastic Custom Castable Abutment, Hexed</td>
</tr>

<tr>
<td>235-217</td>
<td>5.0mm Plastic Custom Castable Abutment, Hexed</td>
</tr>
<tr>
<td>236-217</td>
<td>6.0mm Plastic Custom Castable Abutment, Hexed</td>
</tr>
</tbody>
</table>

Use for multiple-unit, screw-retained restorations. Packaged with an abutment screw (130-300 or 140-300). Natural acetyl (Delrin® or Pomalux®) sleeve. Final torque: 30Ncm.
INDIVIDUAL ABUTMENTS

**PEEK Temporary Abutments**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>273-000</td>
<td>3.5mm PEEK Temporary Abutment</td>
</tr>
<tr>
<td>274-000</td>
<td>4.0mm PEEK Temporary Abutment</td>
</tr>
<tr>
<td>275-000</td>
<td>5.0mm PEEK Temporary Abutment</td>
</tr>
<tr>
<td>276-000</td>
<td>6.0mm PEEK Temporary Abutment</td>
</tr>
</tbody>
</table>

Use for fabrication of cement- or screw-retained provisional restorations (up to 30 days). A direct coping screw (243-320 or 244-320, purchased separately) may be used to maintain screw access hole during fabrication of screw-retained provisional prostheses. Packaged with an abutment screw (130-300 or 140-300). PEEK (PolyEtherEtherKetone) material. Final torque: 30Ncm.

**Titanium Temporary Abutments - Hexed**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>233-215</td>
<td>3.5mm Titanium Temporary Abutment, Hexed</td>
</tr>
<tr>
<td>234-215</td>
<td>4.0mm Titanium Temporary Abutment, Hexed</td>
</tr>
<tr>
<td>235-215</td>
<td>5.0mm Titanium Temporary Abutment, Hexed</td>
</tr>
</tbody>
</table>

Use for single-unit screw-retained, long term temporary restorations (>30 days). Packaged with an abutment screw (130-300 or 140-300). Titanium Alloy. Final torque: 30Ncm.

**Titanium Temporary Abutments - Non-hexed**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>233-214</td>
<td>3.5mm Titanium Temporary Abutment, Non-hexed</td>
</tr>
<tr>
<td>234-214</td>
<td>4.0mm Titanium Temporary Abutment, Non-hexed</td>
</tr>
<tr>
<td>235-214</td>
<td>5.0mm Titanium Temporary Abutment, Non-hexed</td>
</tr>
</tbody>
</table>

Use for multiple-unit, screw-retained, long term temporary restorations (>30 days). Packaged with an abutment screw (130-300 or 140-300). Titanium Alloy. Final torque: 30Ncm.

**Ball-top Screw for Indirect Transfer**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>213-235</td>
<td>3.5mm Ball-top Screw</td>
</tr>
<tr>
<td>214-235</td>
<td>4.0/5.0/6.0mm Ball-top Screw</td>
</tr>
</tbody>
</table>

Use with the 3inOne Abutment to form an impression coping for closed-tray, hexed-timed transfers. Hand-tighten. Titanium Alloy.

*If a 6.0mm abutment is not available, the 5.0mm abutment may be used.*
**Direct Pick-up Copings (Open Tray) - Hexed**

- **243-331**: 3.5mm Direct Pick-up Coping, Hexed
- **244-331**: 4.0mm Direct Pick-up Coping, Hexed
- **245-331**: 5.0mm Direct Pick-up Coping, Hexed
- **246-331**: 6.0mm Direct Pick-up Coping, Hexed

**Direct Pick-up Copings (Open Tray) - Non-hexed**

- **243-321**: 3.5mm Direct Pick-up Coping, Non-hexed
- **244-321**: 4.0mm Direct Pick-up Coping, Non-hexed
- **245-321**: 5.0mm Direct Pick-up Coping, Non-hexed
- **246-321**: 6.0mm Direct Pick-up Coping, Non-hexed

Use to make an open-tray, implant-level, non-hexed impression. Packaged with an extended direct coping screw (243-320 or 244-320). Titanium Alloy. Hand-tighten.

**Implant Analogs**

- **293-000**: 3.5mm Implant Analog
- **294-000**: 4.0mm Implant Analog
- **295-000**: 5.0mm Implant Analog
- **296-000**: 6.0mm Implant Analog

Use in lab to represent the implant in the working cast. Color-coded by implant body diameter. Titanium Alloy.
### Direct Coping Screws

**243-320** 3.5mm Direct Pick-up Screw  
**244-320** 4.0/5.0/6.0mm Direct Pick-up Screw

Packaged with all direct pick-up copings. May also be used in place of an abutment screw when extra length is needed, or to maintain the screw access hole during fabrication of screw-retained provisional prostheses. Up to 7mm can be removed from the screw without losing the hex engagement. Utilizes the .050’ (1.25mm) Hex Driver. Hand-tighten or torque to 30 Ncm depending on application. Titanium Alloy.

### Abutment Screws

**130-300** 3.5mm Abutment Screw  
**140-300** 4.0/5.0/6.0mm Abutment Screw

Low profile screw head. Packaged with all two-piece abutments. Utilizes the .050’ (1.25mm) Hex Driver. Final torque: 30 Ncm. Titanium Alloy.

### Abutment Screws for 7mm length implants

**130-050** 3.5mm Short Abutment Screw, for 7mm  
**140-050** 4.0/5.0/6.0mm Short Abutment Screw, for 7mm

Specifically designed for and packaged with each 7mm length External implant. May be used with all restorative components in lieu of the regular abutment screw. Utilizes .050’ (1.25mm) Hex Driver. Titanium Alloy.

The Locator Implant Attachments are designed for use with overdentures or partial dentures retained in whole or in part by dental implants in the mandible or maxilla. Order by Cuff Height to match the height of the gingival tissue. The abutment will extend above the tissue by 1.5mm to allow the Locator Male to seat completely. Order one Locator Male Processing Set for each Locator Abutment (sold in packs of 2 or 10). Titanium Alloy.

The Male Processing Package provides 3 choices of retention. The Replacement Males (clear, pink and blue) are used to restore implants with up to 10° of divergence (20° between implants). The Extended Range Replacement Males (green and red) accommodate divergences from 10° and 20° (40° between implants), and may be purchased separately.

Locator Components

LCT

Core Tool
Multi-purpose tool serves as hand driver for seating Locator Abutments onto the implants, seating tool for nylon male inserts and insert removal tool.

LMPP-2

Locator Male Processing Package (2 pack)
Includes: (2) Denture Caps with (2) Black Processing Males; (2) White Block-out Spacers; (2) Clear, (2) Pink and (2) Blue Nylon Males.

LMPP-10

Locator Male Processing Package (10 pack)
Includes: (10) Denture Caps with (10) Black Processing Males; (10) White Block-out Spacers; (10) Clear, (10) Pink and (10) Blue Nylon Males.

**BALL ABUTMENTS AND COMPONENTS**

**Ball Abutments**

- **263-002** 3.5mm Ball Abutment, 2mm Collar
- **263-004** 3.5mm Ball Abutment, 4mm Collar
- **263-006** 3.5mm Ball Abutment, 6mm Collar
- **264-002** 4.0mm Ball Abutment, 2mm Collar
- **264-004** 4.0mm Ball Abutment, 4mm Collar
- **264-006** 4.0mm Ball Abutment, 6mm Collar
- **265-002** 5.0mm Ball Abutment, 2mm Collar
- **265-004** 5.0mm Ball Abutment, 4mm Collar
- **265-006** 5.0mm Ball Abutment, 6mm Collar

Use for retention of tissue-supported overdentures. Ball Abutments may be used for indirect transfer impressions. Ball Abutment Analogs on facing page are used for producing a working cast. Titanium Alloy.

**O-ring Attachment Set**

- **260-100** O-ring Attachment Set

  Standard O-ring attachment for processing into denture. Includes: (1) O-ring encapsulator, (2) Processing O-rings and (2) Clinical O-rings. Recommended for relatively parallel implants (5° of divergence or 10° between implants).

**O-ring Individual Components**

- **260-300** O-ring Encapsulator
  Female receptacle processed into denture. Titanium. 2 per package.

- **260-220** Processing O-ring
  Use for lab processing applications.
  Buna. 12 per package.

- **260-210** Clinical O-ring
  Use for clinical applications.
  Silicone. 12 per package.

*products shown not to scale*
BALL ABUTMENT COMPONENTS

**BCAS**  
Ball Attachment Set  
Includes: (1) Titanium Housing, (3) Female Nylon Inserts - white (more retention), pink (less retention), black (lab processing) and (1) Protective Disk (ref. BCPD, protects tissue during impression making or denture pick-up)

The Ball Attachment system offers several advantages over traditional O-ring attachments:  
- Greater abutment angulation (14° of divergence or 28° between implants)  
- 0.4mm of less mesial/distal/buccal/lingual space  
- Four different levels of retention instead of one

**BCAHT**  
Attachment Housings - Titanium  
For Resin pickup or Soldering.  
2 per package.

**BCIB**  
Black Nylon Insert  
Lab Processing and Chair-side Denture Pick-up.  
2 per package.

**BCIG**  
Green Nylon Insert  
Clinical use.  
2 per package.  
Elastic Retention.

**BCIST**  
Insert Seating Tool  
Use to seat nylon inserts in attachment housings.

**BCIP**  
Pink Nylon Insert  
Clinical use.  
2 per package.  
Soft Retention: 800-950g

**BCIW**  
White Nylon Insert  
Clinical use.  
2 per package.  
Standard Retention: 1200-1300g

**BCDR**  
Directional Rings  
Use for obtaining parallelism.  
0°, 7° and 14° rings. Set of 3.

**BCIY**  
Yellow Nylon Insert  
Clinical use.  
2 per package.  
Extra Soft Retention: 500-550g

**BCR**  
Reamer  
Use to adjust retention of nylon inserts.

**260-400**  
3.5/4.0mm Ball Abutment Analog (2 pack)

**260-500**  
5.0mm Ball Abutment Analog (2 pack)

Use to represent the Ball Abutment/Implant assembly in the working cast. Only use in conjunction with Ball Abutments. Titanium Alloy.

*Abutment for Screw components are now universal for Internal, Tapered Internal, External and Single-stage provided the new Abutments for Screw are used.
For legacy External Abutment for Screw component availability, contact Customer Care.

products shown not to scale
ABUTMENT FOR SCREW COMPONENTS

**Hex Adapter, Abutment for Screw**

**PXHA**
Hex Adapter, Abutment for Screw *

Use to place Abutment for Screw. May be driven by either Hand Wrench, Torque Wrench or AS123 Hand Unit.

**Direct Pick-up Coping, Abutment for Screw**

**PXABDC**
Direct Pick-up Coping, Abutment for Screw

Use to make a direct pick-up impression (open-tray) at the abutment level. Packaged with the Screw (long), Abutment for Screw (PXABSL). Use only with Abutment for Screw. Titanium Alloy.

**Indirect Transfer Coping, Abutment for Screw**

**PXABIC**
Indirect Transfer Coping, Abutment for Screw

Use to make an indirect transfer (closed-tray) impression at the abutment level. Use only with Abutment for Screw. Titanium Alloy.

**Analog, Abutment for Screw**

**PXABA**
Analog, Abutment for Screw

Use at lab to represent the Abutment for Screw/Implant assembly in the working cast. Not for use with implant-level impressions.

**Screw (regular or long), Abutment for Screw**

**PXABSL**
Screw (long), Abutment for Screw (5 pack)

Use in the lab when a longer screw is desired. Use only with the Abutment for Screw. Up to 7mm can be removed from the screw without losing the hex engagement. Hand-tighten or torque to 30Ncm depending on application. Titanium Alloy.

**PXABS**
Screw (regular or long), Abutment for Screw (5 pack)

Use to retain bars or prostheses fabricated with the Abutment for Screw Copings. Utilizes the .050” (1.25mm) Hex Driver. Final torque: 30 Ncm. Titanium Alloy.

*instrument o-rings & c-rings wear out over time. If an instrument is no longer held securely by its associated driver, order a replacement ring through Customer Care.

products shown not to scale
Prosthetic Instrumentation System

320-000 Complete Prosthetic Instrumentation System (shown)
Includes:
• AS123 Hand Unit
• Hand Wrench
• 30 Ncm Torque Wrench
• Sterilization Tray
• .050" (1.25mm) Hex Driver, Regular
• .050" (1.25mm) Hex Driver, Long
• Hex Adapter for Abutment for Screw
• 4mm Square Drive Extender

320-101 Basic Prosthetic Instrumentation Kit (not shown)
Identical to the Complete Prosthetic Instrumentation System, but excludes the AS123 Hand Unit and Hex Adapter for Abutment for Screw.

320-070 Prosthetic Sterilization Tray (not shown)
Autoclavable tray for prosthetic instrumentation (included with the 320-000 and 320-101).

300-070 Prosthetic Sterilization Tray

300-040 Hand Wrench*
Use on drive end of AS123 Hand Unit. Also fits individual Hex Drivers/Adapters and Bone Taps.

300-206 4mm Square Drive Extender*
Replaced 300-205 starting in June 2010. Includes PEEK C-ring for durable retention in Ratchet. Cannot be used with bone taps.

300-100 AS123 Hand Unit*
Provides improved vision and easy access to prosthetic components in posterior regions of the mouth. Hand Wrench and Drivers are sold separately.

300-430 30 Ncm Torque Wrench
Use break-style design to deliver 30 Ncm of torque to prosthetic components.

300-350 (regular) .050" (1.25mm) Hex Driver Regular
Use to tighten all hex-driven prosthetic screws.

300-351 (long) .050" (1.25mm) Hex Driver Regular or Long*
Use to tighten all hex-driven prosthetic screws. In early 2011, a running change was made to improve abutment screw retention and handling.

300-400 .050" (1.25mm) Hex Driver Regular or Long*
Use to tighten all hex-driven prosthetic screws.

6.25mm 12.5mm

PXHA

*instrument o-rings & c-rings wear out over time. If an instrument is no longer held securely by its associated driver, order a replacement ring through Customer Care.

ANCILLARY PROSTHETIC INSTRUMENTATION

**IMPAH**

Abutment Clamp

Use to hold two-piece abutments during delivery and tightening of the Abutment Screw.

**ATW**

ITL Precise Adjustable Torque Wrench

Designed to place both implants and abutments with 9 distinct torque settings (15, 20, 25, 30, 35, 40, 45, 50 and 60 Ncm). A simple twist of the handle locks in precision-engineered torque values and guarantees accuracy and repeatability.

**EL-C12374**

Elos Adjustable Torque Wrench

Lightweight titanium design is easy to use as an adjustable torque wrench or a ratchet. Quickly disassembles for cleaning. No calibration required.

**293-100**

3.5mm Implant Analog Handle

**294-100**

4.0mm Implant Analog Handle

**295-100**

5.0/6.0mm Implant Analog Handle

Use to comfortably hold External abutments for chairside or laboratory preparation. Abutments are secured to the handle with a standard abutment screw. Comes in three platform sizes: 3.5, 4.0mm and 5.0/6.0mm.

**135-351**

.050" (1.25mm) One-piece Hex Driver *

**135-451**

.050" (1.25mm) One-piece Hex Driver, Long *

**134-350**

.050" (1.25mm) Handpiece Hex Driver

**134-450**

.050" (1.25mm) Handpiece Hex Driver, Long

For installation and removal of Cover Screws, Healing Abutments and abutment screws. The Hex Drivers, Long (134-450 and 135-451) are 5mm longer than the standard versions (134-350 and 135-351).

*In early 2011, a running change was made to improve abutment screw retention and handling.*

**123-001**

3.5mm Implant Clean-out Tap Tool

**124-001**

4.0/5.0/6.0mm Implant Clean-out Tap Tool

**122-170**

Abutment for Screw Clean-out Tap Tool

Use to re-thread External implants or Abutments for Screw where the internal threads have become damaged. Requires a standard surgical Ratchet (130-000) or Hand Wrench (300-400) as a drive mechanism.

---

*Instrument o-rings & c-rings wear out over time. If an instrument is no longer held securely by its associated driver, order a replacement ring through Customer Care.*

products shown not to scale
This Surgical Manual serves as a reference for using the External implants and surgical instruments. It is intended solely to provide instructions on the use of BioHorizons products. It is not intended to describe the methods or procedures for diagnosis, treatment planning, or placement of implants, nor does it replace clinical training or a clinician’s best judgment regarding the needs of each patient. BioHorizons strongly recommends appropriate training as a prerequisite for the placement of implants and associated treatment.

The procedures illustrated and described within this manual reflect idealized patient presentations with adequate bone and soft tissue to accommodate implant placement. No attempt has been made to cover the wide range of actual patient conditions that may adversely affect surgical and prosthetic outcomes. Clinician judgment as related to any specific case must always supersede any recommendations made in this or any BioHorizons literature.

Before beginning any implant surgical procedure with BioHorizons implants:

- Read and understand the Instructions for Use that accompany the products.
- Clean and sterilize the surgical tray and instruments per Instructions for Use.
- Become thoroughly familiar with all instruments and their uses.
- Study Surgical Kit layout and iconography.
- Design a surgical treatment plan to satisfy the prosthetic requirements of the case.

### Indications for Use

BioHorizons dental implants may be used in the mandible and maxilla for use as an artificial root structure for single tooth replacement or as abutments for bridgework and denture retention.

### VIP Treatment Planning

Virtual Implant Placement (VIP) treatment planning software is a user-friendly solution that reduces clinical challenges and enhances post-operative outcomes.

- Interactive 2D and 3D treatment planning
- Self processing DICOM converter
- Case viewer available for download from BioHorizons website
Two-stage Protocol

Two-stage surgery was the original protocol developed for placing modern dental implants. In this type of surgery, the implant is placed below the soft tissue and protected from occlusal function and other forces during osseointegration. A low-profile Cover Screw is placed on the implant to protect it from the ingress of soft tissue.

Following osseointegration, a second surgery exposes the implant and a transmucosal Healing Abutment is placed to allow for soft tissue healing and development of a sulcus. Prosthetic restoration begins after soft tissue healing.

Single-stage Protocol

Single-stage surgery may be accomplished with the External implant by placing a healing abutment at the time of initial implant surgery. This eliminates the need for a second surgery to expose the implant. Although the implant is not in occlusal function, some forces can be transmitted to it through the exposed transmucosal element.

Prosthetic restoration begins following osseointegration of the implant and soft tissue healing.

Non-functional Immediate Restoration

Single-stage surgery with non-functional immediate provisionalization provides the patient a non-functioning provisional prosthesis early in the treatment plan. An abutment is placed on the implant at or shortly after surgery, and a provisional restoration is secured to it with temporary cement. The provisional can help contour the soft tissue profile during healing.

Immediate Function Restoration

Single-stage surgery with immediate function is possible in good quality bone where multiple implants exhibiting excellent initial stability can be splinted together. Splinting implants together can offer a significant biomechanical advantage over individual, unsplinted prostheses.
During implant placement, clinicians must apply their best judgment as to the appropriate spacing for individual patient conditions.

Spacing considerations for BioHorizons External implants (measurements are taken at the osseous crest):

The osteotomy centerpoint required to maintain a 1.5mm implant-to-tooth spacing (generally accepted) is $\frac{1}{2} \text{[implant body diameter]} + 1.5\text{mm}$.

The osteotomy center-to-center measurement required to maintain a 3.0mm edge-to-edge spacing (generally accepted) between External implants is $\frac{1}{2} \text{[sum of 2 implant body diameters]} + 3.0\text{mm}$.

Implant Spacer / Depth Probe

**Purpose:** Multi-function instrument for intraoral measurements.
- Five centimeter graduated ruler on shaft

The rectangular end of the tool provides intraoral measurements.

Useful for marking center-to-center implant spacing on the ridge.

The rectangular end against an existing crown places the osteotomy ~4.25mm from the contact.

Probe tip measures osteotomy depth.

*Note: these markings are different than the tapered drill markings*
The External Surgical Kit uses an intuitive layout to guide the surgeon through the instrument sequence. The sequence begins in the upper left hand corner and works left-to-right and then down. Color-coded lines, instruments and grommets are matched with each implant and further aid in instrument selection and identification.

Prior to use, clean and sterilize the surgical tray and instruments per appropriate Instructions for Use and study the Surgical Kit layout, color-coding and iconography. Surgical assistants should also be thoroughly familiar with all instruments and their uses.
The depth marks are consistent throughout the Starter Drill, Depth Drills and Width Increasing Drills. The thick bands are each one millimeter wide. Thin lines are used to mark 7mm and 11mm.

**Drilling Considerations**

Peri-operative oral rinses with a 0.12% Chlorhexidine Digluconate solution have been shown to significantly lower the incidence of post-implantation infectious complications. A preoperative 30-second rinse is recommended, followed by twice daily rinses for two weeks following surgery.

Drilling must be done under a constant stream of sterile irrigation. A pumping motion should be employed to prevent overheating the bone. Surgical drills and taps should be replaced when they are worn, dull, corroded or in any way compromised. BioHorizons recommends the replacement of drills after 12 to 20 osteotomies. A Drill-usage Tracking Chart is available from BioHorizons to aid offices in archiving this important information.

There is a risk of injury to the mandibular nerve associated with surgical drilling in lower posterior regions. To minimize the risk of nerve injury, it is imperative the clinician understand the drill depth markings in order to correlate implant length with the actual drilling depth to produce the desired vertical placement of the implant.
OSTEOTOMY INITIALIZATION

2.0mm Starter Drill

**Purpose:** Initiates osteotomy.

- Chisel-tip design eliminates “skating” on osseous crest
- Initiates osteotomy to desired depth
- Prepares site for Paralleling Pins

2.5mm Depth Drill

**Purpose:** Sets osteotomy depth following use of the 2.0mm Starter Drill.

- Efficient cutting drill design collects bone for autografting

Purpose: Sets osteotomy depth following use of the 2.0mm Starter Drill.

- Fixed circular ring acts as a definitive drill stop
- One drill length for each implant length
- 1 mm laser-etched line guides supracrestal implant placement
- BioHorizons Surgical Kit includes spare slots for Depth Drills with Stops
- Please call for availability

2.5mm Depth Drill with Stop

2.5 x 12mm Depth Stop Drill

12mm long External Implant

2.5mm Depth Drill without Stop

*products shown not to scale*
Parallel Pins

**Purpose:** Evaluation of osteotomy position and angle.

- Provided straight and with a 20° angle
- Use after 2.0mm Starter Drill and 2.5mm Depth Drills
- 9mm shank for radiographic evaluation of proximity to adjacent anatomy
- Hub diameter is 4.0mm

Width Increasing Drills

**Purpose:** Incrementally widens the osteotomy without creating excessive heat.

- Depth-marked for reference. Non-end cutting geometry for added safety
- Efficient cutting geometry collects bone for autografting
- Color-coded by the smallest diameter implant body with which it is used

Variations in bone density or possible voids require surgeons to observe the drill’s depth markings as the primary determinant of drilling depth, rather than relying exclusively on the non-end cutting geometry to stop the drill.

If a Width Increasing Drill fails to reach the planned depth as shown by the depth marks, use the 2.5mm Depth Drill to re-establish the depth and recommence the Width Increasing Sequence with the 3.0mm Width Increasing Drill.

*products shown not to scale*
CRESTAL BONE DRILLS & BONE TAPS

**Purpose:** Removes cortical bone at ridge crest to facilitate pressure-free seating of the implant collar.

- Site Specific. Indicated when dense cortical bone is present at crest
- Rounded non-end cutting hub centers drill in osteotomy
- Used following the final Width Increasing Drill for each implant
- 850–2,500 rpm with steady irrigation

Do not fully seat the drill if all or a portion of the collar is to be left supracrestal. Fully seating the drill allows the implant to be placed with the prosthetic platform level with the crestal ridge.

**Bone Taps**

**Purpose:** Prepares dense cortical bone for implant threads.

- Site specific
- 30 rpm or less
- Final instrument prior to implant placement
- Square drive shaft interfaces with Ratchet and Hand Wrench

Place the tip of the Bone Tap into the osteotomy, apply firm apical pressure and begin rotating slowly in a clockwise direction (30 rpm or less is recommended). When the threads engage, allow the tap to feed without excessive pressure. To remove, rotate the Bone Tap in a counter-clockwise direction, allowing it to back out of the osteotomy.

*Do not pull on the Bone Tap to remove it from the site.*
Implant Packaging

External implants are provided in a blister pack with multiple peel-and-stick labels for affixing to the patient’s chart. When the lid of the blister tray is removed, the sterile implant vial is exposed and may then be placed in the sterile field. While holding the vial in an upright fashion, remove the cap by rotating it in a counter-clockwise direction. The implant can then be removed from the vial by engaging the premounted 3inOne Abutment with the appropriate Adapter.
**Purpose:** Engages the 3inOne Abutment allowing the implant to be driven into the osteotomy.

- Premounted 3inOne Abutment serves as the surgical drive mount
- O-ring secures implant while it is carried to osteotomy
- Electric handpiece or manual insertion options
- 30 rpm or less

Handpiece and Ratchet Adapters engage External implants via the square on the coronal aspect of the 3inOne abutment. Remove the cap from the inner vial and seat the chosen Adapter. Remove the implant from the vial and carry it to the osteotomy on the Adapter, taking precautions not to touch the implant surface during the transfer.

Place the apex of the implant into the osteotomy, apply firm apical pressure and begin rotating in a clockwise direction (30 rpm or less). Once the apical threads engage the bone, allow the implant to feed without excessive pressure.

Overtightening the implant in the osteotomy may cause osseous microfracture or pressure-induced necrosis of the adjacent bone. Manual seating via the Adapter for Ratchet may be desired to gain a tactile sense of final implant placement. If too much resistance is felt during insertion, remove the implant and revise the osteotomy with the appropriate Crestal Bone Drill or Bone Tap as deemed necessary to reduce insertion torque.

The dimple on the Adapters align with any of the four external flats on the abutment.
3inOne Abutment Removal

To remove the 3inOne Abutment, engage the Abutment Screw with the .050” (1.25mm) Hex Driver. Apply firm apical pressure to the Hex Driver and rotate counter-clockwise until the screw is completely disengaged from the implant body.

In soft bone, or when the implant lacks initial stability, an Abutment Clamp (ref IMPAH, sold separately) should be used to grasp the outside of the abutment to provide counter-torque during the loosening of the Abutment Screw.

The 3inOne Abutment and the Abutment Screw should be retained with the patient’s chart. They can later be used in the impression making procedure and as a temporary or final abutment for cement retention.

Hex Orientation

The longest flat surface on the external aspect of the 3inOne Abutment is indexed to one of the six flats of the implant’s external hexagon. In most cases one of the hex flats should be oriented to the facial aspect, as it allows for angulation correction with stock angled abutments. Placing the long flat of the 3inOne Abutment to the facial also leaves more room for porcelain in that area on the final prosthesis.

The implant’s rotational position can be adjusted following removal of the 3inOne Abutment using the Implant-level Insertion Tools.

Insertion Tools (Implant-level)

**Purpose:** Engages external hex allowing implant’s position to be adjusted in the osteotomy.

- May be used following removal of the 3inOne Abutment
- Offers a narrower path of insertion and better clearance than the 3inOne Abutment / Abutment-level Adapter option
- Square drive shaft interfaces with the Ratchet and Hand Wrench

Mate the appropriate Insertion Tool with the external hex of the implant and lightly screw into place. Engage the Insertion Tool with either the Ratchet or Hand Wrench and rotate the implant to the required position.
COVER SCREWS & HEALING ABUTMENTS

**Cover Screws**

**Purpose:** Protects prosthetic platform in two-stage (submerged) surgical protocols.

- Packaged with each implant in the sterile inner vial
- Hand-tighten (10-15 Ncm) utilizing .050” (1.25mm) Hex Driver
- Color-coded by implant body diameter

Remove the 3inOne Abutment and thoroughly irrigate the inside of the implant to remove blood and other debris. Unscrew the Cover Screw (included in each implant vial) from its holder and screw it into the implant using the .050” (1.25mm) Hex Driver. Following placement of the Cover Screw, the surgical site should be irrigated and the soft tissue adapted in a normal surgical fashion. Take precautions to prevent the Cover Screw from being aspirated by the patient.

**Healing Abutments**

**Purpose:** Transmucosal element for single-stage surgical protocol or for soft tissue healing period following second-stage uncovery.

- Select by height and emergence profile
- Hand-tighten (10-15 Ncm) utilizing .050” (1.25mm) Hex Driver
- Color-coded by implant body diameter
- Encoded for easy intraoral identification, for example: 4 x 4.5 indicates 4.0mm implant diameter x 4.5mm high

Healing Abutments are placed after uncovery in a two-stage surgical protocol, or in lieu of a Cover Screw in a single-stage (non-submerged) protocol. Prior to seating the Healing Abutment, thoroughly irrigate the inside of the implant to remove blood and other debris. An antibacterial paste may be placed on the screw portion to decrease the risk of bacterial growth within the implant body during the healing phase. Following seating, irrigate the surgical site and adapt the soft tissue in normal surgical fashion. A gingivectomy or apically positioned flap technique may be used to reduce the soft tissue thickness and to decrease sulcular depth around the implant. The suture groove on the Healing Abutment may be used to apically position the soft tissue flap. Take precautions to prevent the Healing Abutment from being aspirated by the patient.

**All 7mm implants come packaged with a special Cover Screw and Abutment Screw that have shorter guide pins for complete seating into the 7mm implant. Standard length Abutment Screws and Healing Abutments can be used provided the guide pin is carefully removed at the notch using a high-speed carbide disk. Please refer to the External -7mm Length Implants manual (ref. L0151) for detailed information.**
ANCILLARY INSTRUMENTS

Bone Profiler

**Purpose:** Remove and contour excess bone and soft tissue from the area of the prosthetic platform.

- Compatible with latch-type, speed-reducing handpieces
- 850-2,500 rpm drill speed with steady sterile irrigation
- Cover Screw protects implant platform
- Bone Profiler cuts away excess bone and soft tissue
- Color-coded by specific prosthetic platform

⚠️ Do not use the Profiler without the Cover Screw in place.

The Cover Screw aligns the Bone Profiler and protects the implant from damage. The Profiler is used in a latch-type, reduction handpiece under copious amounts of sterile irrigation. Following removal of the excess bone and soft tissue, unscrew the Cover Screw from the implant and seat the desired prosthetic element.

Bur Testing Gauge

Also called a “Go / No-Go Gauge,” the Bur Testing Gauge is used to verify the dimensional accuracy of drill shanks of latch-type burs. Burs in proper condition **WILL** fit into the larger diameter hole, but **WILL NOT** fit into the smaller hole (marked red).

Burs that fail either of these criteria are unfit for use and may become stuck in the handpiece if used. The gauge is included with all W&H starter packages, and may also be ordered separately.

Surgical Kit Cleaning

All BioHorizons Surgical Kits are provided non-sterile and must be cleaned and sterilized prior to use following the associated Instructions for Use. Always remove instruments from packaging prior to sterilization, and remove and discard packaging materials used to stabilize and secure kits during shipment. Double-check all surgical instruments to ensure their functionality prior to surgery. Backup sterile drills are also recommended.

⚠️ Caution: The use of hydrogen peroxide or other oxidizing agents will cause damage to the surface of the instruments. Towel- or air-dry all instrumentation before sterilizing. Drills should be replaced after approximately 12 to 20 osteotomy cycles, depending on the bone density.

Proper testing, cleaning and calibration of sterilization equipment should occur frequently to assure that the units are in proper working order. Equipment operating conditions vary and it is the responsibility of each dental office to ensure that the proper sterilization technique for instrumentation is followed.
A period of unloaded healing is often recommended, depending on individual patient healing rates and initial implant stability. Each case must be independently evaluated. This unloaded healing period allows for integration between the bone and implant surface.

The patient must be instructed to follow a post-surgical regimen including cold packs for 24 hours post-implantation. The patient’s diet should consist of soft foods and possibly liquid dietary supplements. Pharmacological therapy should be considered as the patient’s condition dictates.

If a removable prosthesis is used during the initial healing phase, it is recommended that a soft liner material be used to prevent pressure on the surgical site. This soft liner should be relieved over the implant site. The patient should be checked periodically to monitor healing of the soft tissues and bone using clinical and radiographic evaluations.

Ongoing hygiene for the implant patient is vital. Hygiene recall appointments at three month intervals are suggested. Instruments designed for implant scaling, such as Implacare® instruments from Hu-Friedy® should be utilized. The stainless steel handles may be fitted with assorted tip designs used for hygiene on natural teeth. The Implacare® scalers will not damage implant abutments and contain no glass or graphite fillers that can scratch titanium implant abutments.
Symbol Descriptions for Product Labeling

- **STERILE**: Sterile by gamma irradiation
- **Non-sterile**: Non-sterile
- **Rx Only**: Caution: Federal (USA) law restricts these devices to the sale, distribution and use by, or on the order of, a dentist or physician.
- **LOT**: Lot/batch number
- **REF**: Reference/article number
- **Prosthetic platform**: 3.5mm Prosthetic Platform, 4.0mm Prosthetic Platform, 5.0mm Prosthetic Platform, 6.0mm Prosthetic Platform

BioHorizons products carry the CE mark and fulfill the requirements of the Medical Devices Directive.

**ORDERING & WARRANTY INFORMATION**

**Product Support Specialist:**

**Cell phone:**

**Fax:**

**BioHorizons Lifetime Warranty on Implants and Prosthetics:** All BioHorizons implants and prosthetic components include a Lifetime Warranty. BioHorizons implant or prosthetic components will be replaced if removal of that product is due to failure (excluding normal wear to overdenture attachments).

**Additional Warranties:** BioHorizons warranties instruments, surgical drills, taps, torque wrenches and Virtual Implant Placement (VIP) treatment planning software.

1. **Surgical Drills and Taps:** Surgical drills and taps include a warranty period of ninety (90) days from the date of initial invoice. Surgical instruments should be replaced when they become worn, dull, corroded or in any way compromised. Surgical drills should be replaced after 12 to 20 osteotomies.4

2. **Instruments:** The BioHorizons manufactured instrument warranty extends for a period of one (1) year from the date of initial invoice. Instruments include drivers, sinus lift components, implant site dilators and BioHorizons tools used in the placement or restoration of BioHorizons implants.

3. **VIP treatment planning software:** VIP treatment planning software warranty extends for a period of ninety (90) days from the date of initial invoice. The warranty requires that VIP be used according to the minimum system requirements.

4. **Compu-Guide surgical templates:** Compu-Guide surgical templates are distributed without making any modifications to the submitted Compu-Guide Prescription Form and VIP treatment plan (“as is”). BioHorizons does not make any warranties expressed or implied as it relates to surgical templates.

**Return Policy:** Product returns require a Return Authorization Form, which can be acquired by contacting Customer Care. The completed Return Authorization Form should be included with the returned product. For more information, please see the reverse side of the invoice that was shipped with the product.

**Disclaimer of Liability:** BioHorizons products may only be used in conjunction with the associated original components and instruments according to the Instructions for Use (IFU). Use of any non-BioHorizons products in conjunction with BioHorizons products will void any warranty or any other obligation, expressed or implied. Treatment planning and clinical application of BioHorizons products are the responsibility of each individual clinician. BioHorizons strongly recommends completion of postgraduate dental implant education and adherence to the IFU that accompany each product. BioHorizons is not responsible for incidental or consequential damages or liability relating to use of our products alone or in combination with other products other than replacement or repair under our warranty. Compu-Guide surgical templates are ordered under the control of a Clinician. The Clinician recognizes responsibility for use. Therefore, regardless of the real or proven damages, the liability to BioHorizons is limited to the price of the product directly related to the reason for the claim.

**Distributed Products:** For information on the manufacturer’s warranty of distributed products, please refer to their product packaging. Distributed products are subject to price change without notice.

**Validity:** Upon its release, this literature supersedes all previously published versions.

**Availability:** Not all products shown or described in this literature are available in all countries. BioHorizons continually strives to improve its products and therefore reserves the right to improve, modify, change specifications or discontinue products at any time.

Any images depicted in this literature are not to scale, nor are all products depicted. Product descriptions have been modified for presentation purposes. For complete product descriptions and additional information, visit shop.biohorizons.com.
Not all products shown or described in this literature are available in all countries.
