

Eliminate loose dentures

Millions of people around the world are missing enough teeth to require the use of a denture. Many of them struggle to keep their dentures secure, particularly in the lower jaw. If you have this problem, you already know about the embarrassment of slipping dentures, not being able to eat the foods that you love and the problems with denture adhesives.

Ask your dentist how to restore and maintain your natural smile with implant-supported dentures from BioHorizons, an implant manufacturer with a high success rate — that's why your implant provider has chosen them over all the others on the market!

Restore your confidence

Too many people who have conventional dentures don't wear them for the simple fact that they don't stay in place. Dental implants offer a way to keep dentures in place and allow you to go about your daily life with confidence.

More than 5 million dental implants are placed each year in the United States¹ with a track record spanning over 50 years, so you can feel confident about their effectiveness and long-term durability. Properly cared for, implants can last a lifetime — that's what makes them such a good value.

Denture stabilization benefits

- Restores proper chewing, allowing a better diet and improved health
- Improves speech and confidence
- Increases comfort with less irritation of gum tissue
- Eliminates the cost and inconvenience of denture adhesives
- Can often utilize your existing denture and be done in as little as one day
- Minimally invasive procedure typically with little to no discomfort

Get the picture-perfect smile you deserve with dental implants!

What to expect

During the procedure, titanium implants are placed in the jaw. The procedure typically takes about an hour and can be done under local anesthesia. Your existing denture is modified to sit comfortably over the implants during the healing phase.

Discomfort from the procedure is usually minor. Over-the-counter medication is typically all that's needed. Your dentist will suggest a modified diet during the initial healing phase.

After the implants have healed, posts (or abutments) are connected to the implants and your denture is modified to snap onto the abutments. The denture will be secure but can easily be removed for cleaning.

Post-operative care

Cleaning consists of removing your denture at night and brushing around your implants. Brushing also stimulates blood flow and promotes healthy gum tissue. Follow your doctor's post-operative instructions and maintain your dental hygiene to ensure the long-term success of your treatment.

Overdenture inside view

Before treatment

Patient unhappy with denture instability

During healing

Two to four implants are placed with abutments that attach to denture

After treatment

Modified denture securely snaps into place for stability and confidence

Are you a candidate

Every patient is different and patient results may vary. Only a trained clinician can choose the best treatment plan for you. Please ask your doctor to explain the benefits and risks to determine if denture stabilization with implants is right for you.
